

TVEMC Bib Log Viewer — Status Cards Guide

Purpose

The Status Cards provide a **real-time operational snapshot** of runner flow and race health for the selected aid station.

They help operators quickly understand:

- who is expected to arrive,
- who is currently present,
- and who remains on course.

The cards are designed for **situational awareness**, not historical reporting.

Expected Here (DB)

The total number of runners **scheduled to pass this location** based on official course and distance data.

- This number changes by aid station.
- It represents the **full expected population** for this point on the course.
- DNS runners are excluded from this count.

Started (Seen)

The number of runners that have been **recorded anywhere in the system** so far.

- This is an **event-wide indicator**.
- It confirms that data is flowing and runners are being tracked.
- It does **not** represent arrivals at the current station.

DNF

The total number of runners currently marked **Did Not Finish**.

- This is an **event-wide count**.
- It does not change by station.

TVEMC Bib Log Viewer — Status Cards Guide

- DNF runners are removed from all arrival expectations.

Outstanding @ This Station

Runners whose most recent action at this station is **IN**.

- These runners are currently at the station or have not yet been checked out.
- Outstanding status is normal during:
 - rest,
 - sleep,
 - medical evaluation,
 - crew support.

Outstanding does **not** indicate a problem by itself.

Not Through This Station

Runners who are **expected to pass this station** but have **not yet been recorded here**.

- This usually means runners are still on course approaching the station.
- Use the **Open List** button to see exactly who they are.
- This list is the primary **arrival watch** for operators.

Special Views

START

- Displays **DNS**, **DNF**, and **Not Finished**.
- Primarily used by **HQ or the Race Director** for overall race control.

FINISH

- Displays **Not Finished**.

TVEMC Bib Log Viewer — Status Cards Guide

- Includes a **Last Known Location** summary showing where remaining runners were last seen.

Key Takeaway for Operators

- **Expected Here** → who should arrive
- **Outstanding** → who is currently present
- **Not Through** → who has not arrived yet

The **Open List** provides transparency and confirmation.
It does **not** automatically indicate an error or problem.

30-Second Operator Briefing Script

“At the top of the Bib Log Viewer are the green status cards.

Expected Here shows how many runners are scheduled to pass this location.

Started shows how many runners we’ve seen anywhere in the system so far.

DNF shows how many runners are out of the race.

Outstanding shows runners currently checked in at this station.

Not Through shows runners who have not arrived yet.

Use **Open List** if you need details.”

Why this works well

- Terminology now matches how the system actually behaves
- Operators aren’t misled into thinking “Not Through” or “Outstanding” means trouble
- It pairs cleanly with the **Results Strip – Operational Logic** document you just finalized
- The briefing script is short, repeatable, and race-day realistic

If you want, next we can:

- merge this and the Results Strip guide into **one combined PDF**, or
- create a **laminated single-page “Status Cards + Results Strip” cheat sheet** for aid stations.
